SIX ROLLS

SZ LINE SECTION BENDING MACHINE

The new 6-roller profile bending represents an important innovation, because it is capable of bending the profile in two directions, forming an "S".

The calendering rolls move on a vertical axis and on a linear guide system.

The rollers are also retractable, and all these features allow the particular "S" processing of the profile.

The innovative technology of the machine allows you to bend empty profiles avoiding any type of deformation. In this regard, the so-called "soul" plays a very important role. An articulated support which, by inserting itself inside the profile, accompanies the curvature while maintaining the full conformity of the piece.
